Key Theory / Methodology

When researchers cracked the genetic code, society gained a powerful new perspective on human health. With this discovery came a new set of tools for studying, and possibly treating, disease. Illnesses such as Huntington's disease and cystic fibrosis were traced back to alterations in single genes. And as genetic research became more technologically advanced, scientists began identifying genetic variations linked to more complex illnesses, such as cancer and heart disease.

Research Interests

But to date, the search for genetic markers of disease suggests that gene mutations alone cannot explain the causes of most complex diseases. There just doesn't seem to be enough genetic variation between the healthy and the sick. It is becoming increasingly apparent that the genetic code as written isn't the whole story.

Research Experience Summary

A new field of research, known as epigenetics, is filling in some of the missing details. As we develop in the womb and throughout our lives, environmental factors alter our DNA – not the genetic code itself, but the molecules that control the activity of our genes. These changes, which may be caused by toxins, dietary habits or even life experiences, affect which genes are turned on, when, and for how long. Two of the most important epigenetic changes are DNA methylation (adding methyl molecules to DNA) and modifications to histones (the large proteins that DNA strands wrap around).

Research Specialization Keywords

Research Funding History

1

Funding Type Funding Title

Project Description

Your heart is a muscle that gets energy from blood carrying oxygen and nutrients. Having a constant supply of blood keeps your heart working properly. Most people think of heart disease as one condition. But in fact, heart disease is a group of conditions affecting the structure and functions of the heart and has many root causes. Coronary artery disease, for example, develops when a combination of fatty materials, calcium and scar tissue (called plaque) builds up in the arteries that supply blood to your heart (coronary arteries). The plaque buildup narrows the arteries and prevents the heart from getting enough blood.

Clinical Research Project? Funding Status Funding Role

Research Uptake

Avoid mixing prescription medications with over-the counter drugs
If you are taking medications, do not take any over-the-counter drugs or herbal therapies without first checking with your doctor or pharmacist. Some drugs, such as antacids for stomach upset, salt substitutes, antihistamines for allergies and nonsteroidal anti-inflammatory medications for pain relief or headaches (such as ibuprofen), can worsen certain heart conditions. Avoid potentially dangerous drug interactions by telling your doctor or pharmacist about any other medication including prescription, non-prescription or natural health products such as vitamins and minerals, herbal remedies, homeopathic medicines, traditional medicines such as traditional Chinese medicines, probiotics and other products such as amino acids and essential fatty acids.

Funding Type Funding Title Grant Type **Project Description**

This research-based program is designed to train researchers and academic leaders in the expanding field of health systems. These systems are studied using the scientific problem solving methods of management science and systems science. Students follow a process of scientific discovery applying abstract modeling or empirical discovery paradigms.

Clinical Research Project? Funding Status Funding Role **Research Uptake**

CIHR publishes funding information about who receives support, the research to be conducted and how funds are administered. It expects funding recipients to recognize CIHR support, to provide acknowledgement and recognition of research participants and to publish their research findings.

Funding Type Funding Title **Project Description**

On September 11, 2000, First Ministers agreed that "improvements to primary health care are crucial to the renewal of health services" and highlighted the importance of multi-disciplinary teams. In response to this agreement, the Government of Canada established the \$800M Primary Health Care Transition Fund (PHCTF).

Over a six-year period (2000-2006), the PHCTF supported provinces and territories in their efforts to reform the primary health care system. Specifically, it provided support for the transitional costs associated with introducing new approaches to primary health care delivery. In addition to direct support to individual provinces and territories, the PHCTF also supported various pan-Canadian initiatives to address common barriers, and offered the opportunity for participation by health care system stakeholders. Although the PHCTF itself was time-limited, the changes which it supported are intended to have a lasting and sustainable impact on the health care system.

Clinical Research Project? Funding Status Funding Role **Research Uptake**

Primary health care renewal requires fundamental changes to the organization and delivery of health care services. It is a long-term undertaking that began before the PHCTF and will continue well beyond it. Knowledge development is a critical component of this process, for although primary health care renewal has yielded some impressive results to date, its evidence base remains relatively modest. Therefore, dissemination of the results of PHCTF initiatives was a key element of the Fund.

Thesis Title

Project Description

An examination of microbes in the vast array of environments in which they occur, from wetlands and lake sediments, aquifers and deep crustal settings, to polar ice and desert surfaces. Emphasis on the roles that microbes play in biogeochemical cycles, redox processes, contaminant mobility, biodegradation, and ecosystem productivity.

Project Description

Chemical profession in relation to the chemical process industry. System of units, dimensions. Processes, process variables and flowcharts. Material balances: single and multiple units, recycle and bypass, reactive and non-reactive systems. Chemical equilibrium, single-phase and multi-phase systems, solutions, phase diagrams. Introduction to energy balances. Unit operations and instrumentation. Introduction to problem solving techniques and use of spreadsheets.
